

PC-Doctor Service Center™

The **#1** most trusted PC service & repair solution worldwide

Service Center 7.5 uses the same PC-Doctor diagnostics as 4 of the world's top 5 PC manufacturers to increase your testing accuracy, troubleshooting efficiency, and professional image. After identifying hardware issues using the PC-Doctor diagnostics and completing repairs, Service Center verifies that the problems are no longer present. The reports you generate for your customers can include your logo, contact information, and technician's name, as well as a complete system inventory that includes model and serial numbers, every test you ran on the system, and the action you took to fix the problem.

The Service Center Advantage

Service Center significantly advances the capabilities of the PC diagnostic kit that repair depots, manufacturers, independent computer repair shops and other professionals have used for years to troubleshoot hardware issues. In addition to updated diagnostics, the new kit delivers faster testing and the ability to take detailed snapshots of the system under test to clearly show all changes made to hardware and drivers. The snapshots can be included in Service Center's customizable reports that can also include your company's logo and contact information.

- The loopbacks and optional power supply tester and PCI/miniPCI POST cards help you find problems fast
- The Multipurpose USB Device indicates test status and stores configuration files, customizable reports, system snapshots, your customized links, and other information
- Direct System Information™ architecture gathers information directly from devices, bypassing drivers where possible
- Runs under Windows 7, Vista, XP, Server 2003, and the included offline bootable OS
- Run direct from CD or the Multipurpose USB Device with no installation
- Documentation includes an advanced user guide with 100+ pages of detailed test descriptions and instructions
- Free referrals - the only repair product supported by a technician database that refers customers to you

Save Time, Money, Increase Service Quality

Service Center is used by professional PC technicians, managed service providers, repair centers, computer retailers, enterprise IT organizations, low-volume manufacturers, system designers and serious hobbyists.

Save time, save money, and increase your product or service quality by using Service Center to accurately diagnose hardware problems, to ensure component quality and functionality, and to provide the most extensive system information available.

The Leading PC Diagnostic Repair Kit

The computer hardware diagnostic tests included in PC-Doctor's Service Center allow professional technicians and system builders alike to find quick, accurate solutions to computer problems.

If you offer PC, server or laptop repair services, the diagnostics in Service Center will help you identify problems quickly. The customizable reports will explain problems and solutions to your customers, and improve your professional image.

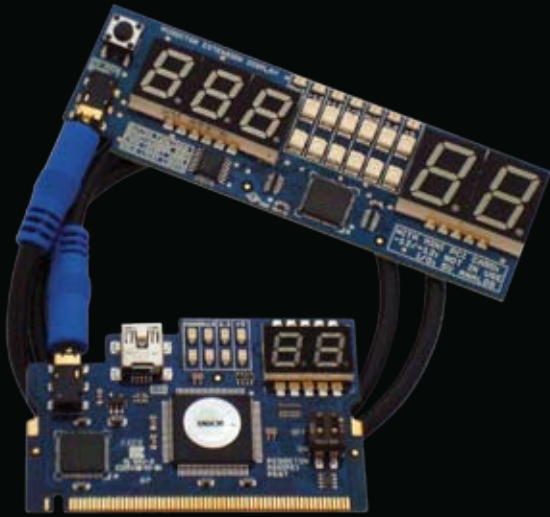

866-289-7237

“ Service Center has been a time saver for our company. We advertise professional level diagnostics on our website to our clients. This is professional level diagnostic software. We have paid much more for diagnostic utilities in the past that are nowhere near as thorough or user friendly as this one. Customer satisfaction is what keeps clients coming back to us for service. This product is a key ingredient to our success! Great customer support after the sale is just another reason to rest assured you have made a wise purchase. ”

- Anthony Bellamy, Cyber Solutions Computer Repair

New miniPCI POST Card

The new optional miniPCI POST card makes diagnosing unbootable notebooks easier and utilizes the same remote display used by the PCI POST card.

The cards verify the integrity of your power supply connections when the system executes the Power On Self Test (POST). The cards also display the clock speed of the PCI bus as well as voltage readings.

The cards display codes that indicate what the system BIOS is doing prior to loading the operating system. If the system fails to boot, the last POST code from the BIOS is shown on the 2-digit LED display, pinpointing the operation that failed.

Diagnose Unbootable Systems

Boot and test from the included CD or Multipurpose USB Device — even if the installed OS and/or hard drive are dead/non-existent.

Diagnose the Latest Components

- New test coverage includes new video tests, memory tests, Win7 tests, and much more!
- Test up to 64GB of memory

Solve Intermittent Problems

Run the system load test and parallel tests to stress the system and expose intermittent problems.

Service Center Kit Includes

- Diagnostic CD for both Windows testing and low-level hardware testing through the included offline OS
- Multipurpose USB Device that is bootable to the offline OS
- CD and DVD test media
- Four loopback devices for RJ45, serial, parallel, and audio ports
- Drive Erase Tool (included as a utility with the offline OS)
- Comprehensive documentation for advanced product usage

Service Center Premier Kit Includes

- Service Center Kit
- PCI POST Card
- miniPCI POST Card
- Power Supply Tester
- Bootable Windows PE Diagnostics CD provides testing in the PE environment
